

- *Recording is triggered by events received through the "d-channel" monitoring feature of the voice interface board (for both trunk-side and station-side recording). Audio is transcoded to standard media files by the voice interface board.*
- *CTI/OAI integration (optional) may be available to support additional triggering and metadata collection capabilities.*
- *Phone models and trunk types determine supportability and maximum distance limits determine server placement. Contact VPI Sales Engineering for additional information and/or requirements.*
